

The importance of colour

Historically, successful shade matching has been a combination of art, science and, unfortunately, luck.

Using the science of dentistry to match the artistry of natural dentition, the dental profession has continued to advance the field of aesthetic restorative dentistry. We as technicians now have materials and technologies available that make undetectable restorations possible on a consistent basis.

The success of restorative dentistry is determined on the basis of functional and aesthetic results. To achieve aesthetics, four basic determinants are required in sequence; Position, Contour, Texture, Colour. The knowledge of the concept of colour is essential for achieving good aesthetics.

Here at Stephen Green one of the tools we use is the Vita Easyshade, this is a cordless device that delivers instant, accurate shades regardless of lighting conditions and other elements which can lead to improper shade measurements. The unit uses a digital spectrometer and LED fibre optic light source that rests on the tooth, this used in conjunction with the skill and years of training of our professionals means that we can accurately determine the correct shade of the tooth.

Features & Benefits

- Reliable shade measurement within a few seconds
- Exact shade determination in VITA classical A1-D4, VITA SYSTEM 3D-Master.
- Independent of ambient lighting
- Easy to use with maximum freedom of movement
- Prevention of infection guaranteed
- Reliable communication and documentation of shades
- Quality control thanks to the possibility to verify restorations
- Extended durability thanks to modern LED technology

Coming to the right place
